

Turn Site Data Into Measurable Operational Insight

Gain clearer visibility of BioHygiene purchasing across your organisation and identify opportunities to improve consistency, adoption, and operational performance

Managing cleaning operations across multiple sites requires consistency, but variations in product purchasing and adoption can be difficult to identify through day-to-day operational reporting. Operations teams are often left relying on separate site reports, local spreadsheets, or information supplied at different times. This can make objective comparison difficult and allow unusual purchasing patterns or inconsistent product adoption to go unnoticed. BioMetrix helps close that gap by bringing verified BioHygiene purchasing data together in one accessible platform, giving operations teams a clearer view across participating sites.

Make Performance Visible Across Your Organisation

Differences between sites do not necessarily indicate poor performance, but they can reveal where further investigation, training, or operational support may be required.

BioMetrix brings the available information together in one accessible platform, helping operations teams to:

- ✓ Compare BioHygiene purchasing across participating locations.
- ✓ Identify unusual patterns and differences between sites.
- ✓ Understand where products and categories are being adopted.
- ✓ Focus operational reviews on areas requiring attention.
- ✓ Support greater consistency across the organisation.
- ✓ Benchmark operational performance across participating sites.

Why Can You Trust the Data?

Verified Distributor Information

Purchasing data is supplied directly by participating distributors rather than relying on manual site-level self-reporting.

Consistent comparisons

Data is processed into a standardised structure, allowing participating sites to be reviewed through the same dashboard format.

Site-level granularity

Information can be filtered by site, product, and date, helping teams move beyond organisation-wide totals.

Transparent data coverage

BioMetrix displays the latest available verified data and the date it was last updated, providing clarity over the reporting period.

Commercial and environmental insight

Product purchasing can be viewed alongside associated CO₂e information, helping connect operational and sustainability objectives.

Exportable underlying data

Teams can download data in Excel or CSV format for further analysis, site reviews, or inclusion within existing reporting processes.

From Site Data to Operational Action

Verified purchasing data from participating distributors is transformed into clear operational insights. BioMetrix then allows authorised users to:

- ✓ Filter results by date, site, and contract.
- ✓ Compare purchasing activity across participating locations.
- ✓ Review spend, quantities, and product categories.
- ✓ Identify patterns that may indicate inconsistent adoption.
- ✓ Highlight sites that may require further investigation or support.
- ✓ Explore associated product-level CO₂e information.
- ✓ Export the underlying data for operational reviews.

Dashboards are accessible through a secure login and updated every four weeks when new distributor data is available.
